

Task one: Tkinter Application:

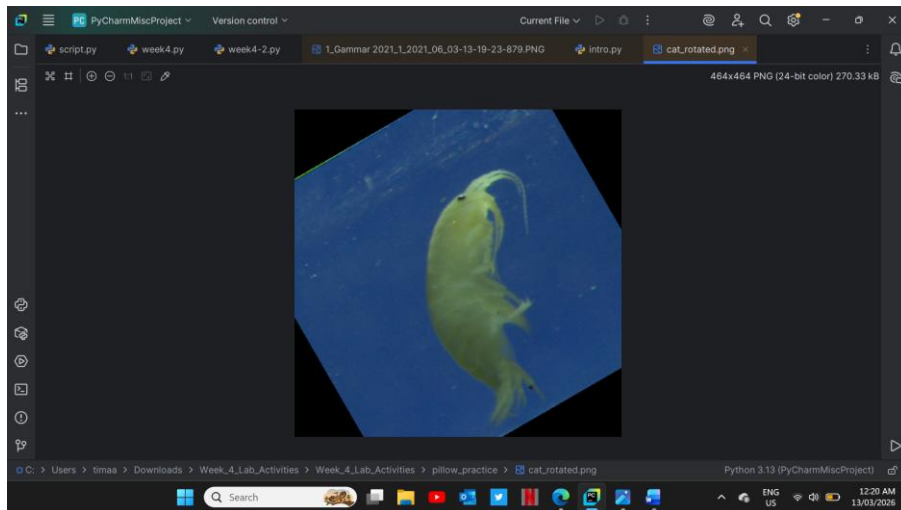

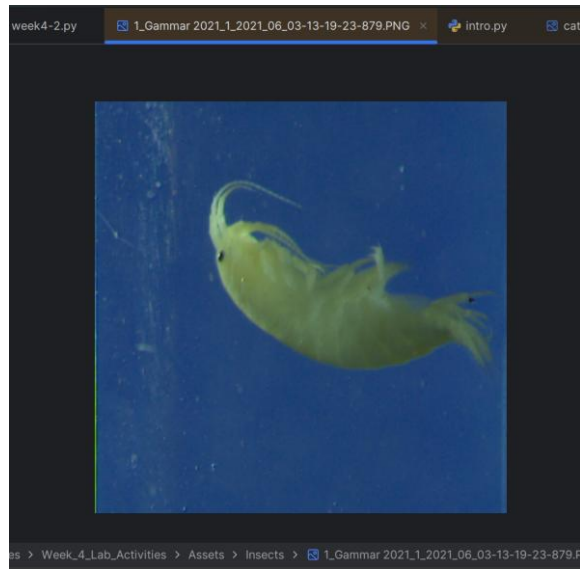

In this task, I ran the Tkinter program provided in the lab files to understand how Python can create a graphical user interface (GUI). The application displayed a simple personal diary interface using different Tkinter widgets such as labels, buttons, and text fields.

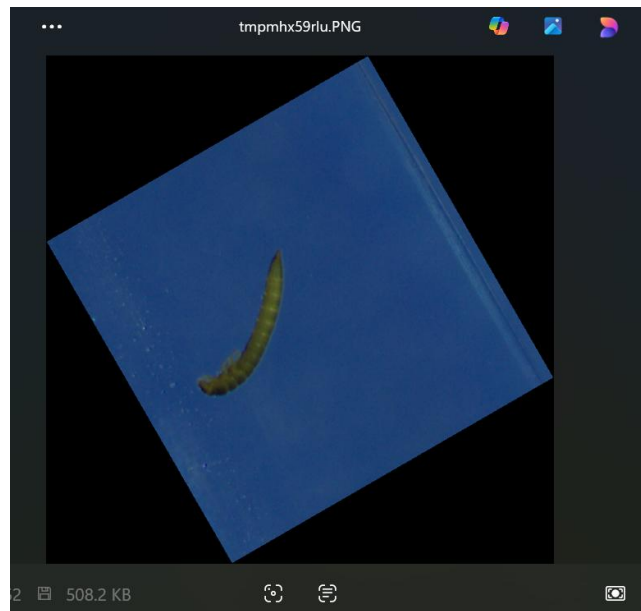

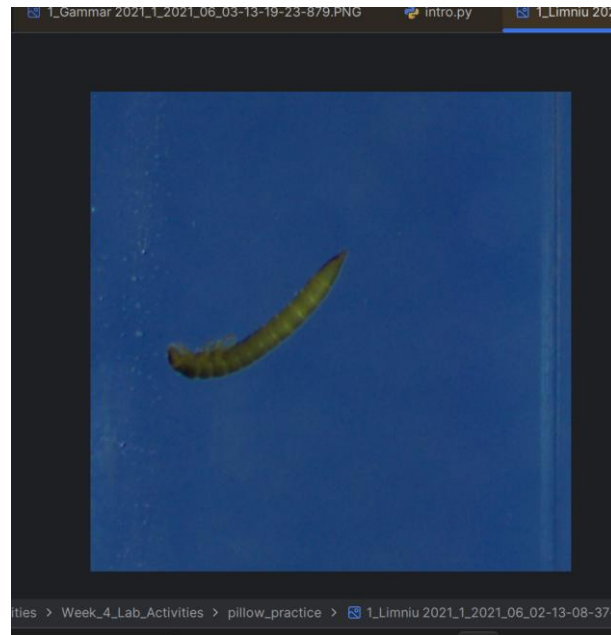

Task two: Pillow Introduction:

In this task, I ran the Python script to understand how the Pillow library can be used to open and analyze an image. The program displayed image information such as the image size, filename, and format, and then showed the image.

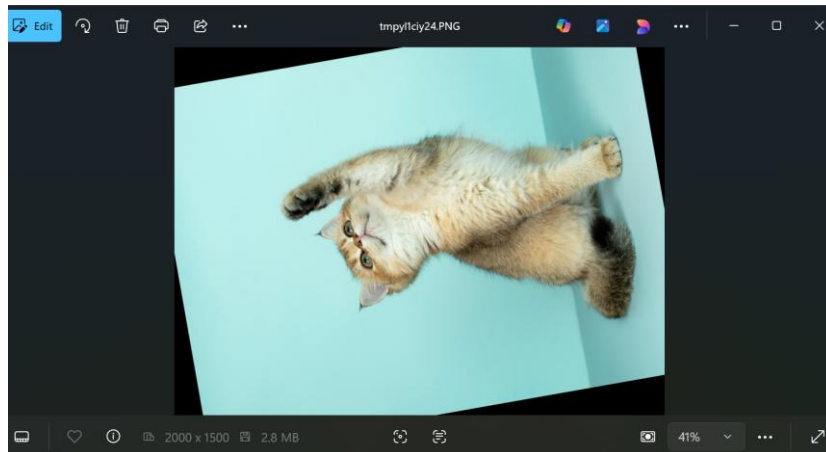

Task three: Image Manipulation:

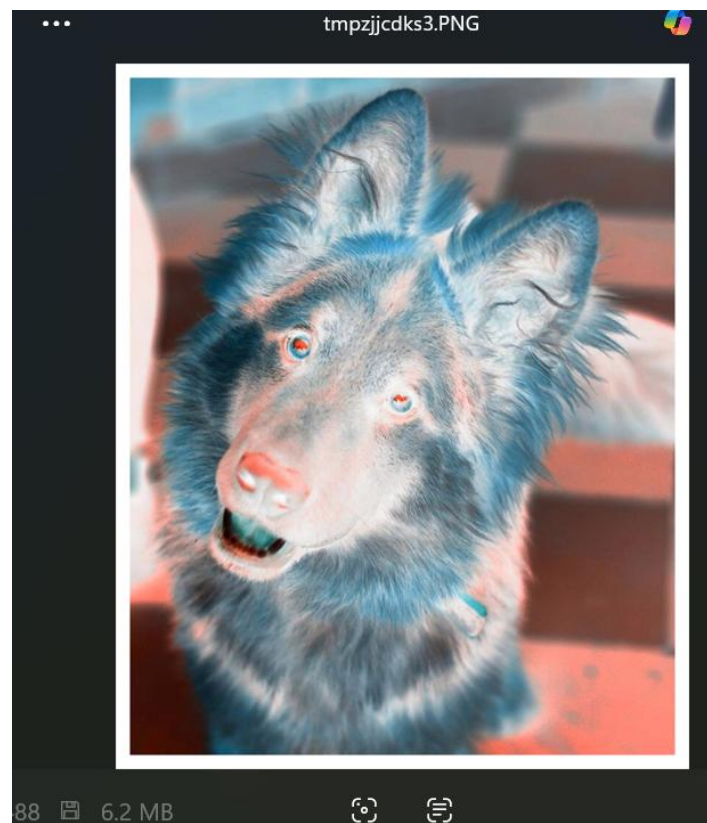

In this task, I executed the provided script to observe how Pillow can manipulate images. The program demonstrated operations such as rotating, resizing, cropping, and combining multiple transformations on the image.

Task four: Understanding pixels and colors

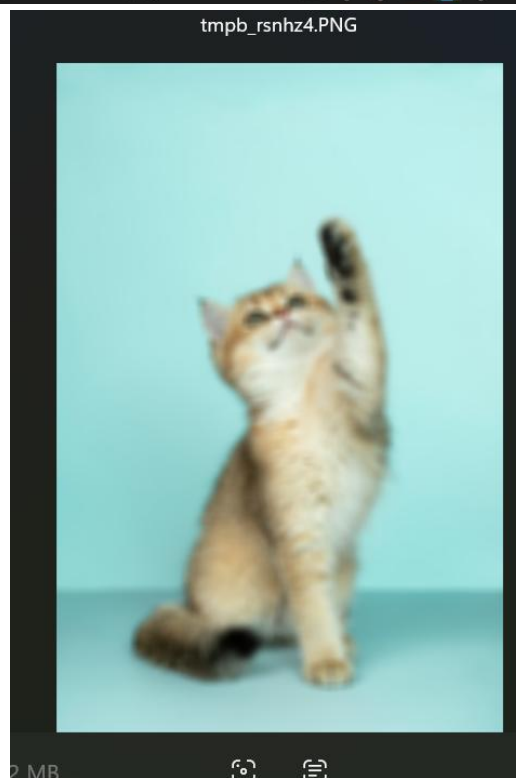

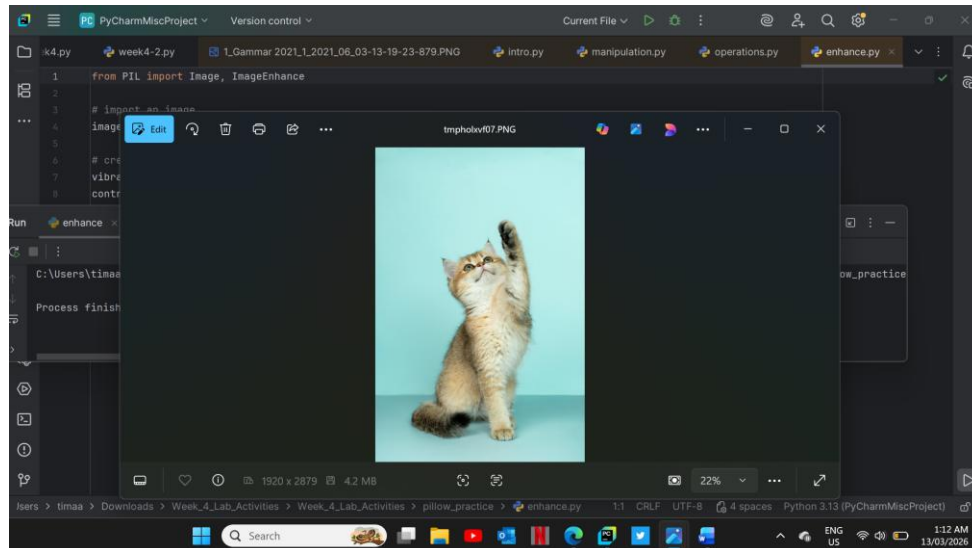

In this task, I ran the program to observe how Python reads and modifies pixel values in an image. This helped me understand how images are composed of pixels and how color values can be accessed and changed.

Task five: Image Enhancement

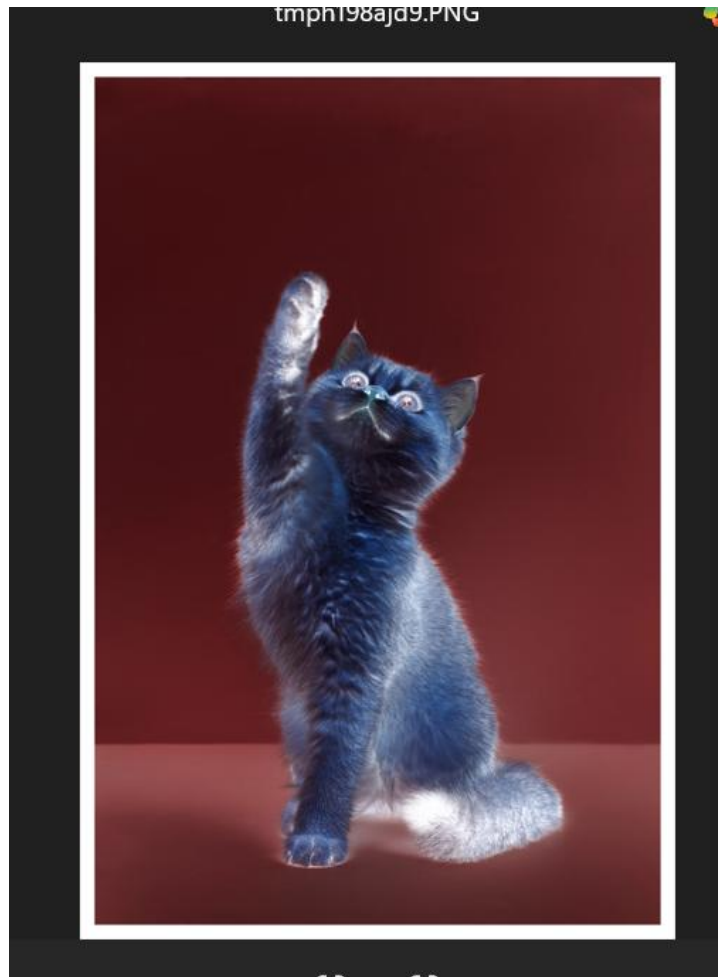

In this task, I ran the script to observe how image enhancement works using the Pillow library. Since the code required *dog.jpg*, I copied the image into the working folder so the program could run correctly and display the enhanced result.

Task six: Image Filter

In this task, I executed the script to observe how different image filters can be applied. The program applied filters such as blur and edge detection to change the appearance of the image.

Task seven: Image Operations

In this task, I ran the provided program to understand how image operations can be applied using the Imagoes module. The script demonstrated operations such as mirroring the image, inverting colours, and adding borders.

In conclusion, this lab helped me understand how Python can be used for basic image processing and graphical applications. By running the provided programs, I observed how images can be manipulated, enhanced, and filtered using the Pillow library, and how Tkinter can be used to create simple graphical interfaces.
